

[KEY AI TECHNOLOGIES]

"ML → NLP → DL → DATA ANALYTICS"

1. Recommendation Systems

- AI analyses user behaviour, browsing history and purchase patterns.
- Suggest relevant products to each user.

Techniques:
content based filtering,
Deep learning

3. FRAUD Detection

- AI detects unusual patterns in transactions.
- helps prevent financial loss and build trust

Techniques:
Anomaly Detection, ML,
Neural Networks

2. Chatbot support

- AI powered chatbots handles customer queries
- Reduces human work load and improve response time.

Techniques:
NLP, ML, intent Recog.

4. Inventory Management

- AI predicts demand for products
- optimizes stock levels
- Reduces overstocking.

Techniques:
Demand Forecasting,
ML, Time Series Analysis.

"AI Transforms e-commerce by delivering smarter, instant support & efficient operation."

"A journey of innovation and intelligence"

1. ARTIFICIAL intelligence (1950-present)
The science of creating machines that can think and act like humans.
Early AI relied rule-based systems
Techniques:
Rule-based systems.

2. MACHINE Learning (1980-5-present)
Machine learns from data and improve performance without being explicitly programmed
Techniques:
linear regression, Decision tree, SVM, KNN

3. DEEP Learning (2000-present)
uses multi-layer networks to learn complex pattern from large amount of data.
Techniques:
CNN, RNN, LSTM, GRU

4. Transformers (2017-present)
Attention mechanism enabling models to understand context with out RNNs
Techniques:
"Attention is all you need" (2017)

5. Generative AI (2014-present)
AI models that can generate new content such as text, images.
Techniques:
GANs (2014)
VQEs, Diffusion models.

6. Large language models (LLMs) (2018-present)
Transformers based models trained on massive text data to understand & generate.
→ BERT (2018), GPT-1 (2018), GPT-2 (2019), GPT-3 (2020), llama, Claude.
